Irwin Naturals Quality Assurance

The importance of quality in our supplement products cannot be overstated. In recognition of this level of importance we proactively address the quality issues at the very beginning of our process. The specifications developed for each product include detailed requirements not only for the product itself but for the individual raw materials used. We believe that addressing the issue "up front" is a superior method to applying a quality system. Applying quality evaluation techniques at the end of the manufacturing process is the second level of evaluation that occurs with every batch of product manufactured. This provides additional assurance that the products delivered meet our quality specifications. Meeting the quality standards at the beginning of the manufacturing process as well as at the end provides a complete answer to the quality issue. The quality standards established and enforced are carried out in facilities that are certified as GMP-compliant through third-party inspection and certification. The total picture of quality includes each of these elements.
